

Flora and Fauna Environmental Protection

- **Bundeena NSW Australia**
Royal National Park
- The client, Sydney Water, were concerned about potential sewage overflows to environmentally sensitive areas in the park and the impact deep construction would have on protected plants and wildlife.
- The client ended up using a combined gravity/pumped/vacuum system covering 1,420 houses in a flood prone area. The Flovac vacuum system was used in the most sensitive areas.
- The environmental agency required, prior to approval, proof that any fault or breakage could be found within a sixty minute period. We showed on a nearby project that all faults could be located within thirty minutes.
