

Protecting Fishing and Aquaculture Reserves

- **Manning Point, NSW Australia**
- The client MidCoast Water were concerned about overflows from existing septic tanks poisoning the commercial oyster beds located along the river. A gravity network would still have an overflow risk and multiple pump stations.
- A Flovac vacuum system was installed not only because of our environmental credentials but also the systems ability to handle high peak flows with two caravan parks at the site.
- When the Minister opened the project, local residents praised the contractor for the minimal amount of disturbance during construction and the speed at which the system was installed.
