

Cyclone Area

- **Machan's Beach Cairns QLD Australia**
- This area in far north Queensland is renown for the cyclones that batter the coast and flood the town during the December – February downpours. The Flovac vacuum system was chosen due to the necessary replacement of the overflowing septic tanks and the need to reduce the disease ridden mosquito population from the town.
- The low maintenance costs and back up support from Flovac will see them become the system of choice in this part of the world. A single generator at the pump station are able to assist with regular power disruptions during the storms.
- Residents have been very complimentary about the reduction in odours and mosquito's.
- Regular flooding occurs during the rainy season and the systems operates normally even when submerged in water.
